

OOPsie Meeting

OOPsie

LP1, 2021

Meeting participants: Love Lindqvist, Petter Blomkvist, Simon Engström,
Axel Larsson, Simon Johnsson

Facilitator: Simon Johnsson

Date: 2021-10-08

§1 Meeting startup

How is everyone?

Simon E. coughs but is using cough syrup, otherwise fine. Petter is just fine. Love is feeling fine. Axel is still having a cold, but is feeling fine.

Meeting objectives

Decide what needs to be done before peer review hand-in due date on sunday (2021-10-10)

§2 Reports

1. Tags in the UI
 - (a) User is now able to add tags during runtime
 - (b) A selected tag cannot be deselected, but only one active is allowed for events
 - (c) Contact tags cannot currently be selected
 - (d) Tags colour can currently not be selected, but a window for selecting colour could be a possible solution.
 - (e) User is currently not being alerted when an error occurs relating to already available tags.
2. RAD
 - (a) Almost finished relating to the current iteration.
 - (b) No issues.
 - (c) Everything except the final GUI should be contained
3. SDD
 - (a) Writing has started, but overlapping points could be an issue.
 - (b) Progress has been going smoothly currently.
 - (c) Points such as the introduction are considered final drafts.

§3 Discussion items

- Definition of done
 1. One definition of done is the completion of all user stories, but some user stories may be incomplete even if the project is considered incomplete.

2. Are definitions of done currently too abstract? Ask supervisor in next meeting.
- Where should file handler be used? Controller/model?
 1. Make file handler adaptable for different directory scenarios. Working directory for file handler can currently be altered by changing a line of code.
 2. Give file handler a directory when instancing it? Controller talks to handle service that returns an ID related to an attachment and then adds it to a contact for instance?
 3. Use an ID for every attachment? Contact contains a list of attachment names instead of the attachments themselves. Contact contains an ID related to its directory.
 - Can we implement database saving and loading?
 1. Yes. Should be finished sometime next week.
 - Should we merge dev with master before turning in for peer review?
 1. The consensus is that this would be a good idea, after we're done with the first iteration.

§4 Outcomes and assignments

Dev branch will be merged into master when first iteration is done. Every contact uses an idea which will relate to its attachment directory. Definitions of done will be clarified in next meeting with supervised. **Next meeting: 2020-10-11 10:30 - 11:45**

Assignments

Axel will finish the functionality for attachments for this sunday. Petter will finish the database save and load features sometime next week.

§5 End of meeting
